

Fake trigger background simulation – status

- Blahoslav Pastirčák, Pavol Bobík,
- Franceso Fenu, Kenji Shinozaki

10th JEM-EUSO Intern. meeting, RIKEN Tokyo Japan,
7th December 2011

Outline

- Motivation
- SW and configuration
- Rates
- Stored information
- Issues since last simulation meeting

Motivation

- Very high statistics of bckg needed to be sure when filtering events → 10^5 events
- It corresponds to 10^{14} GTU's
- Not possible to be simulated by ESAF which is 10^3 slower than presented code and cannot be runned by parallel computing (memory share)
- Fast and standalone code written in C++ developed by Francseco Fenu

The code

- Trigger algorithm implemented (the same as in ESAF)
- One PDM simulated
- PTT alg. → 2nd level → 1Hz/PDM
- LTT alg. → 3rd level → 1 mHZ/PDM
- Bckg source → Poisson ditribution of avg 500 photons/(m² s sr)
- Code fast but since to produce huge statistics has to be run in parallel (on Kosice cluster)

JEM-EUSO Kosice cluster

- Actually used and available for also for collaboration 7*32 cores @ 2.3 Ghz; 25 TB
- Fedora Core 14 1.2.5-2.fc14
- kernel 2.6.35.13-91.fc14.x86_64
- Gcc 4.5.1-4
- Disk space shared by nfs
- ROOT v30.00, ESAF trunk, GEANT4 9.4

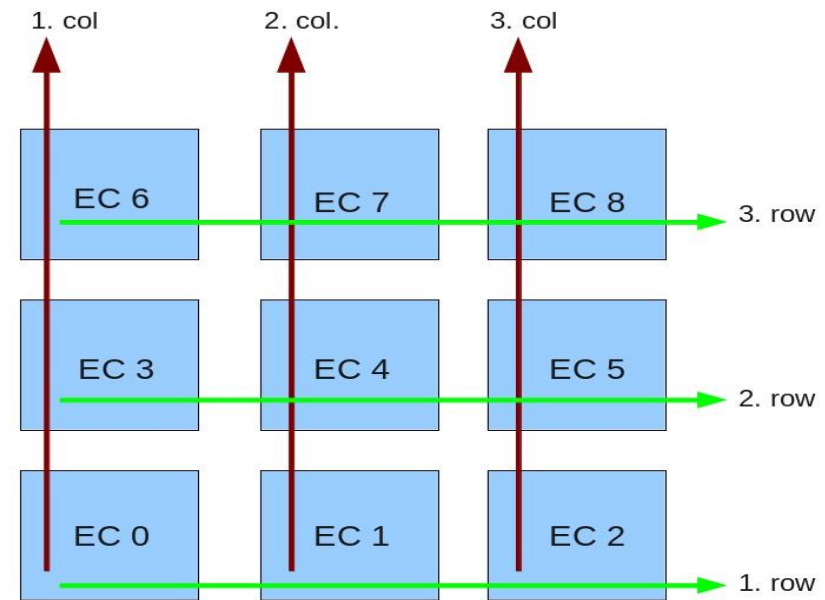

Configuration

M36

BG = 2.1 ph/pix/GTU

PTT_integr = 43

LTT integration = 145

1 PDM = 9 EC = 1296 pixel

1 EC = 4 x PMT = 144 pixel

1 PMT = M 36 = 36 pixel (6 x 6)

Background rate for M36 configuration

Background rate for M36 config

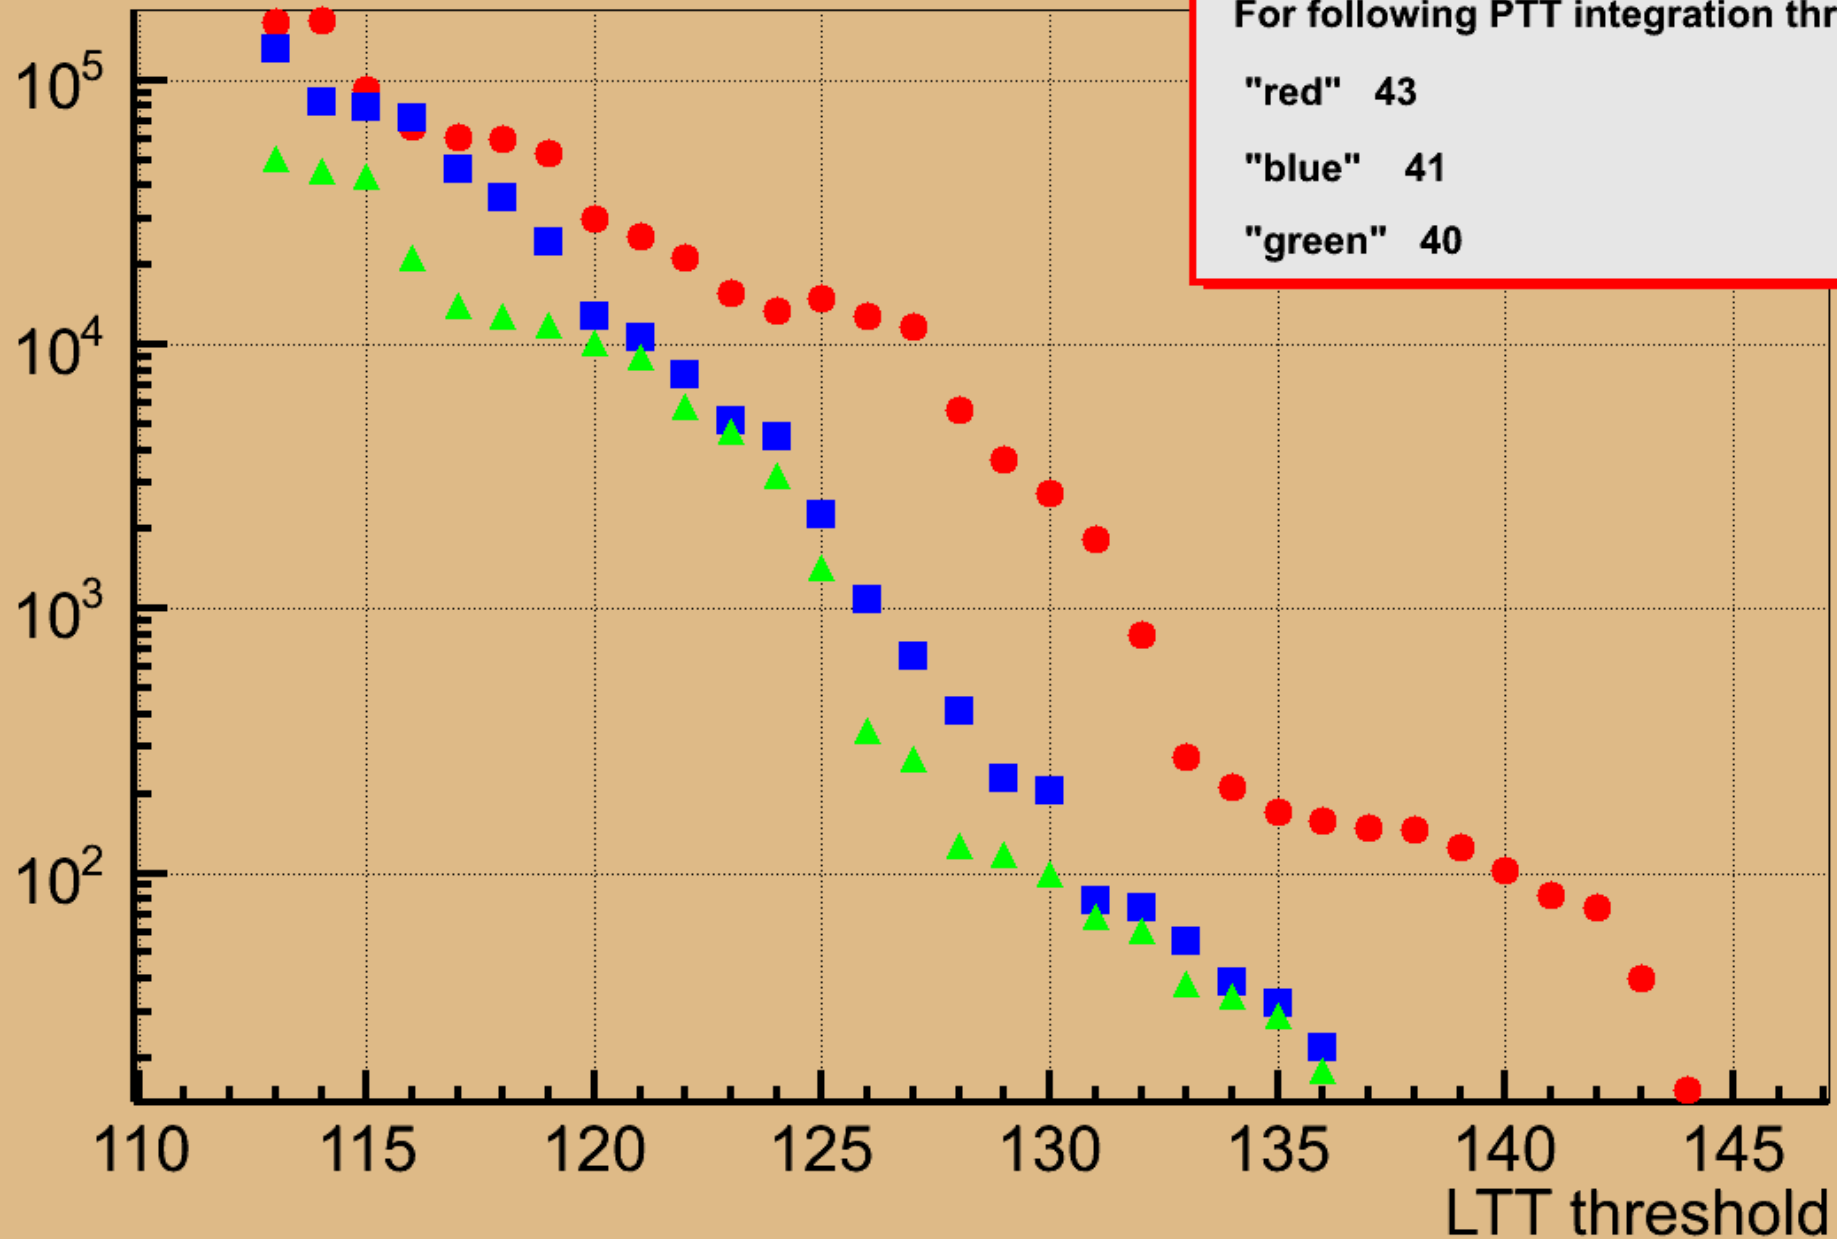

For following PTT integration thresholds

"red" 43

"blue" 41

"green" 40

LTT fake trigger rate

Stored information

- Two files written when thresholds reached:
- PTT_SECOND_OUT → (x,y,pers, ecid,counts)
12x12x5 = 720 lines/pdm
- LTT_SECOND_OUT → (x,y,time,counts)
36x36x31 = 40196 lines/pdm
- Information for which PPT, LTT dumped
(reached threshold)
- Analysis of only pixels contributed to LTT going on

Older result

The information of accumulated LTT triggers stored to ascii file in the 4 column format:

row in EC (0-35) : column in EC (0-35) : time (0-30) : counts/pixel

1 LTT trigger = 36x36x31 lines

Average size of the LTT output : 250 MB/ 1.e9 Gtu's

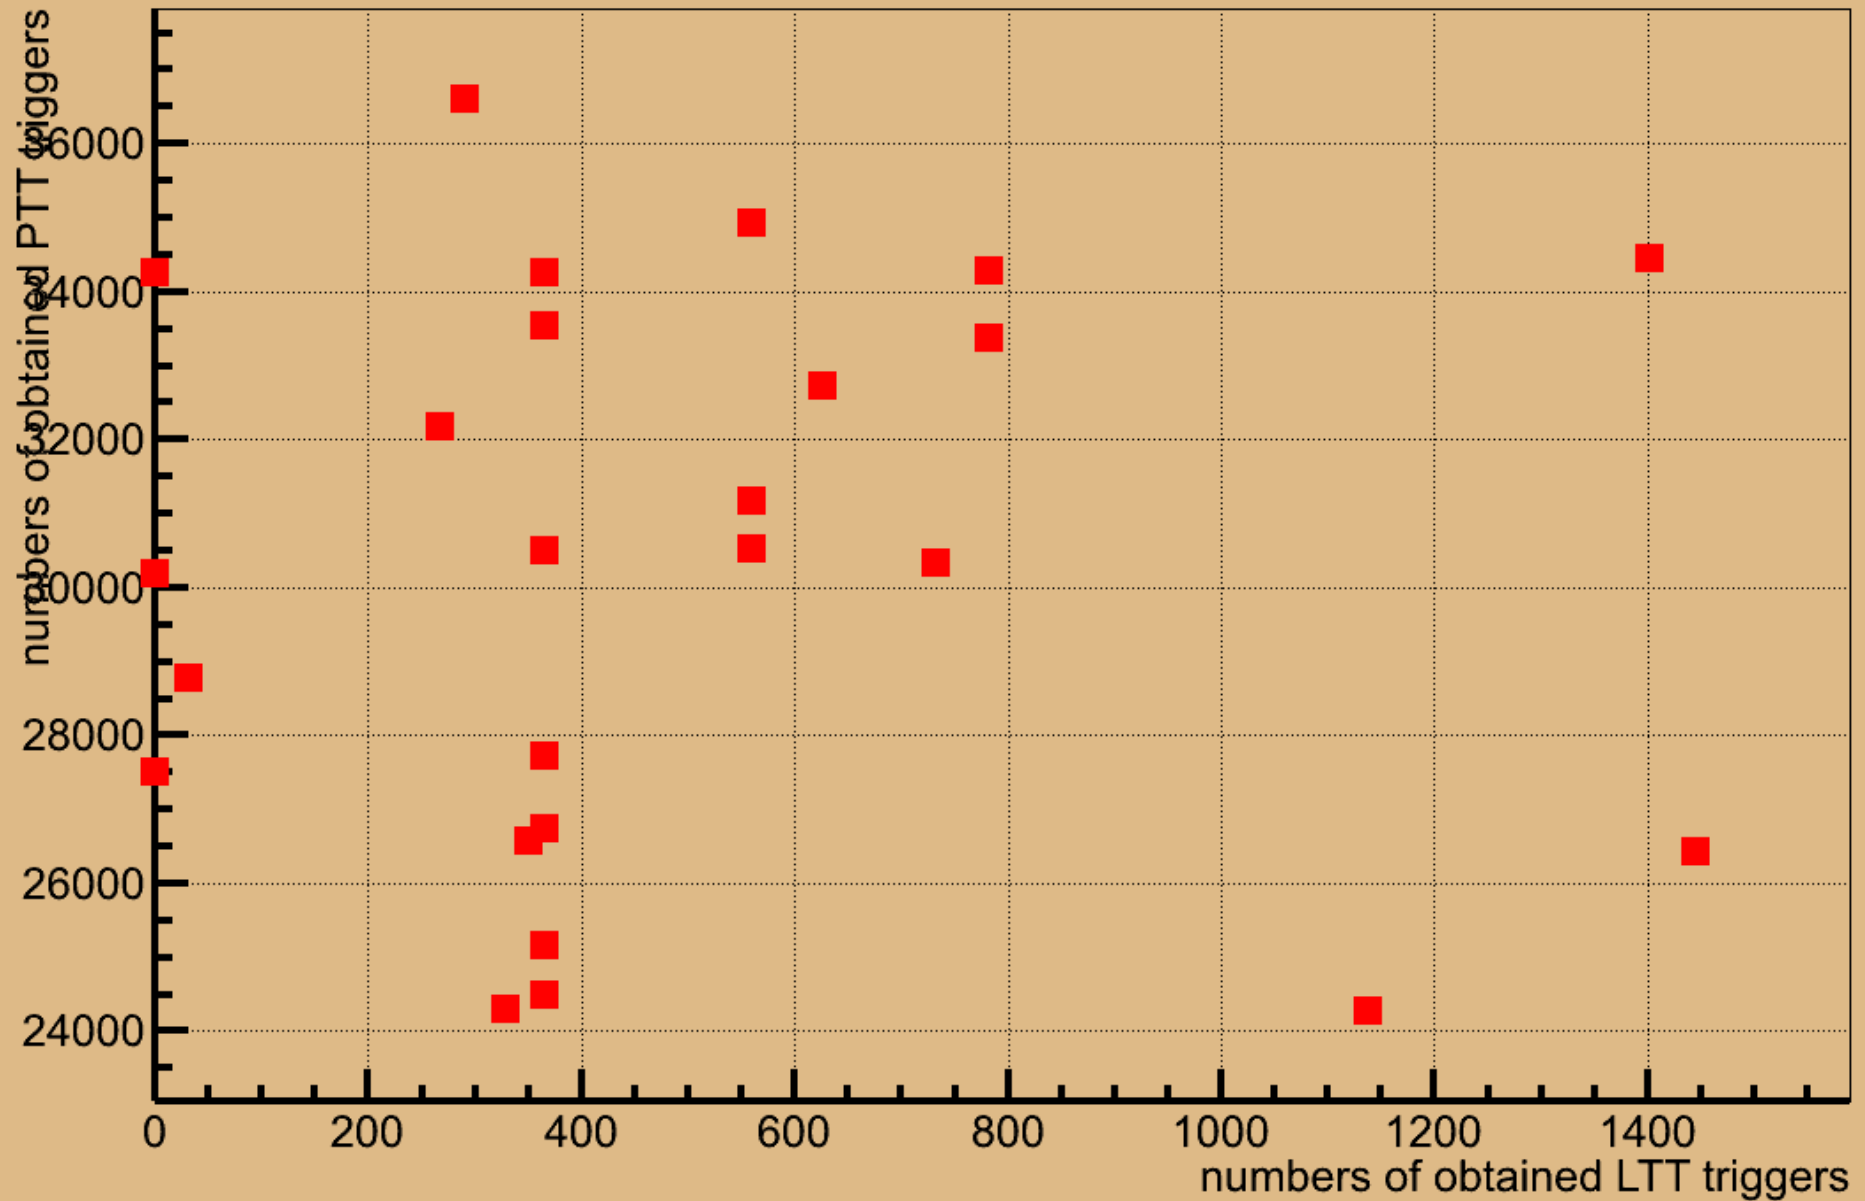

We reprocessed it to store like root ntuples: 10 MB/1.e9 GTU's

	PTT (MB)	LTT (MB)	LTT lines	LTT triggers	lft.ascii (MB)	lft.root (MB)

Run.116	298	172	13659840	340	280	16

Present statistics

- New 10^{12} GTU's simulated during cca 6 weeks on PC cluster (power consumption and not clarified configuration limited higher st.)
- 12 000 LTT triggers → 1mHz/PDM
- 750000 PTT triggers → 0.1 Hz/PDM

Simulated PTT vs LTT triggers

Issues since last simulation meeting

- Checked of the influence of observed bug on obtained data - done
- Random number generation check - done
- Preparation the code for M64 configuration – partially done
- Pattern recognition of the obtained result – under study (contact with Svetlana, possibly Thomas)

Possible problem in the code

- The trigger code extracted from ESAF for determining appropriate threshold values affected: → generate_background and PPT_pre_analysis status executed in the same loop, but has to be accomplished separately
- Results with and without modification of the code were compared at the same initial conditions
- no influence on obtained LTT rates up to 10^9 GTU's

Possible problem in the code

```

Random number generation

- Due to very high generated statistics possible problems with random number generation
- Previously 4 different types of rnd generation according to predefined Poisson distributions investigated from ROOT investigated
- Following schema used for improving
- Check the random seeds -> successfully follow Poisson

Random number generation

Preparation fo M64 config simulations

- Modification of BG – scaled according $(36/64)^2$
- Modify PTT and LTT integration thresholds
- Following background rates for M64 obtained and compared with the result provided by Kenji

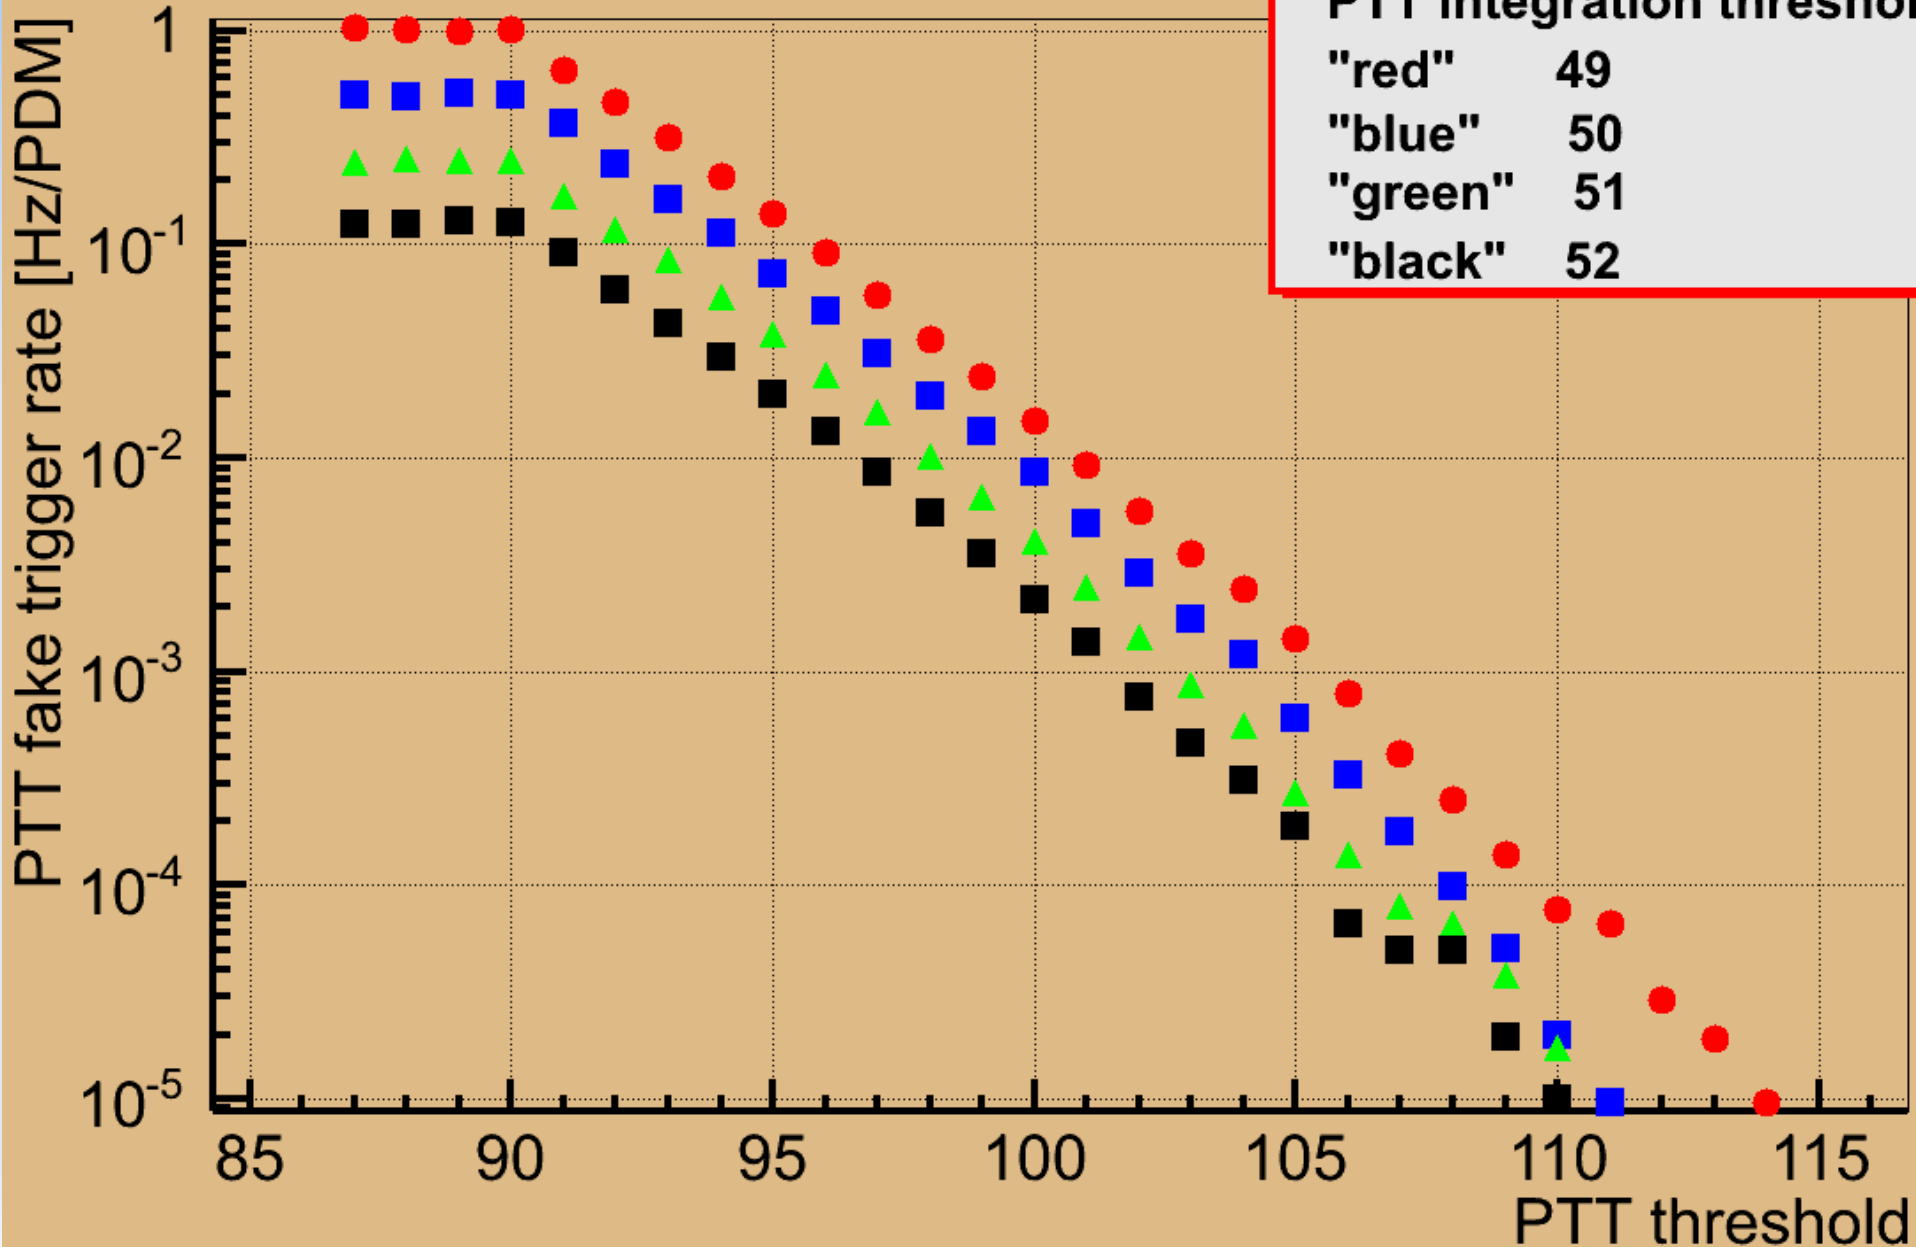

Background rate M64 config

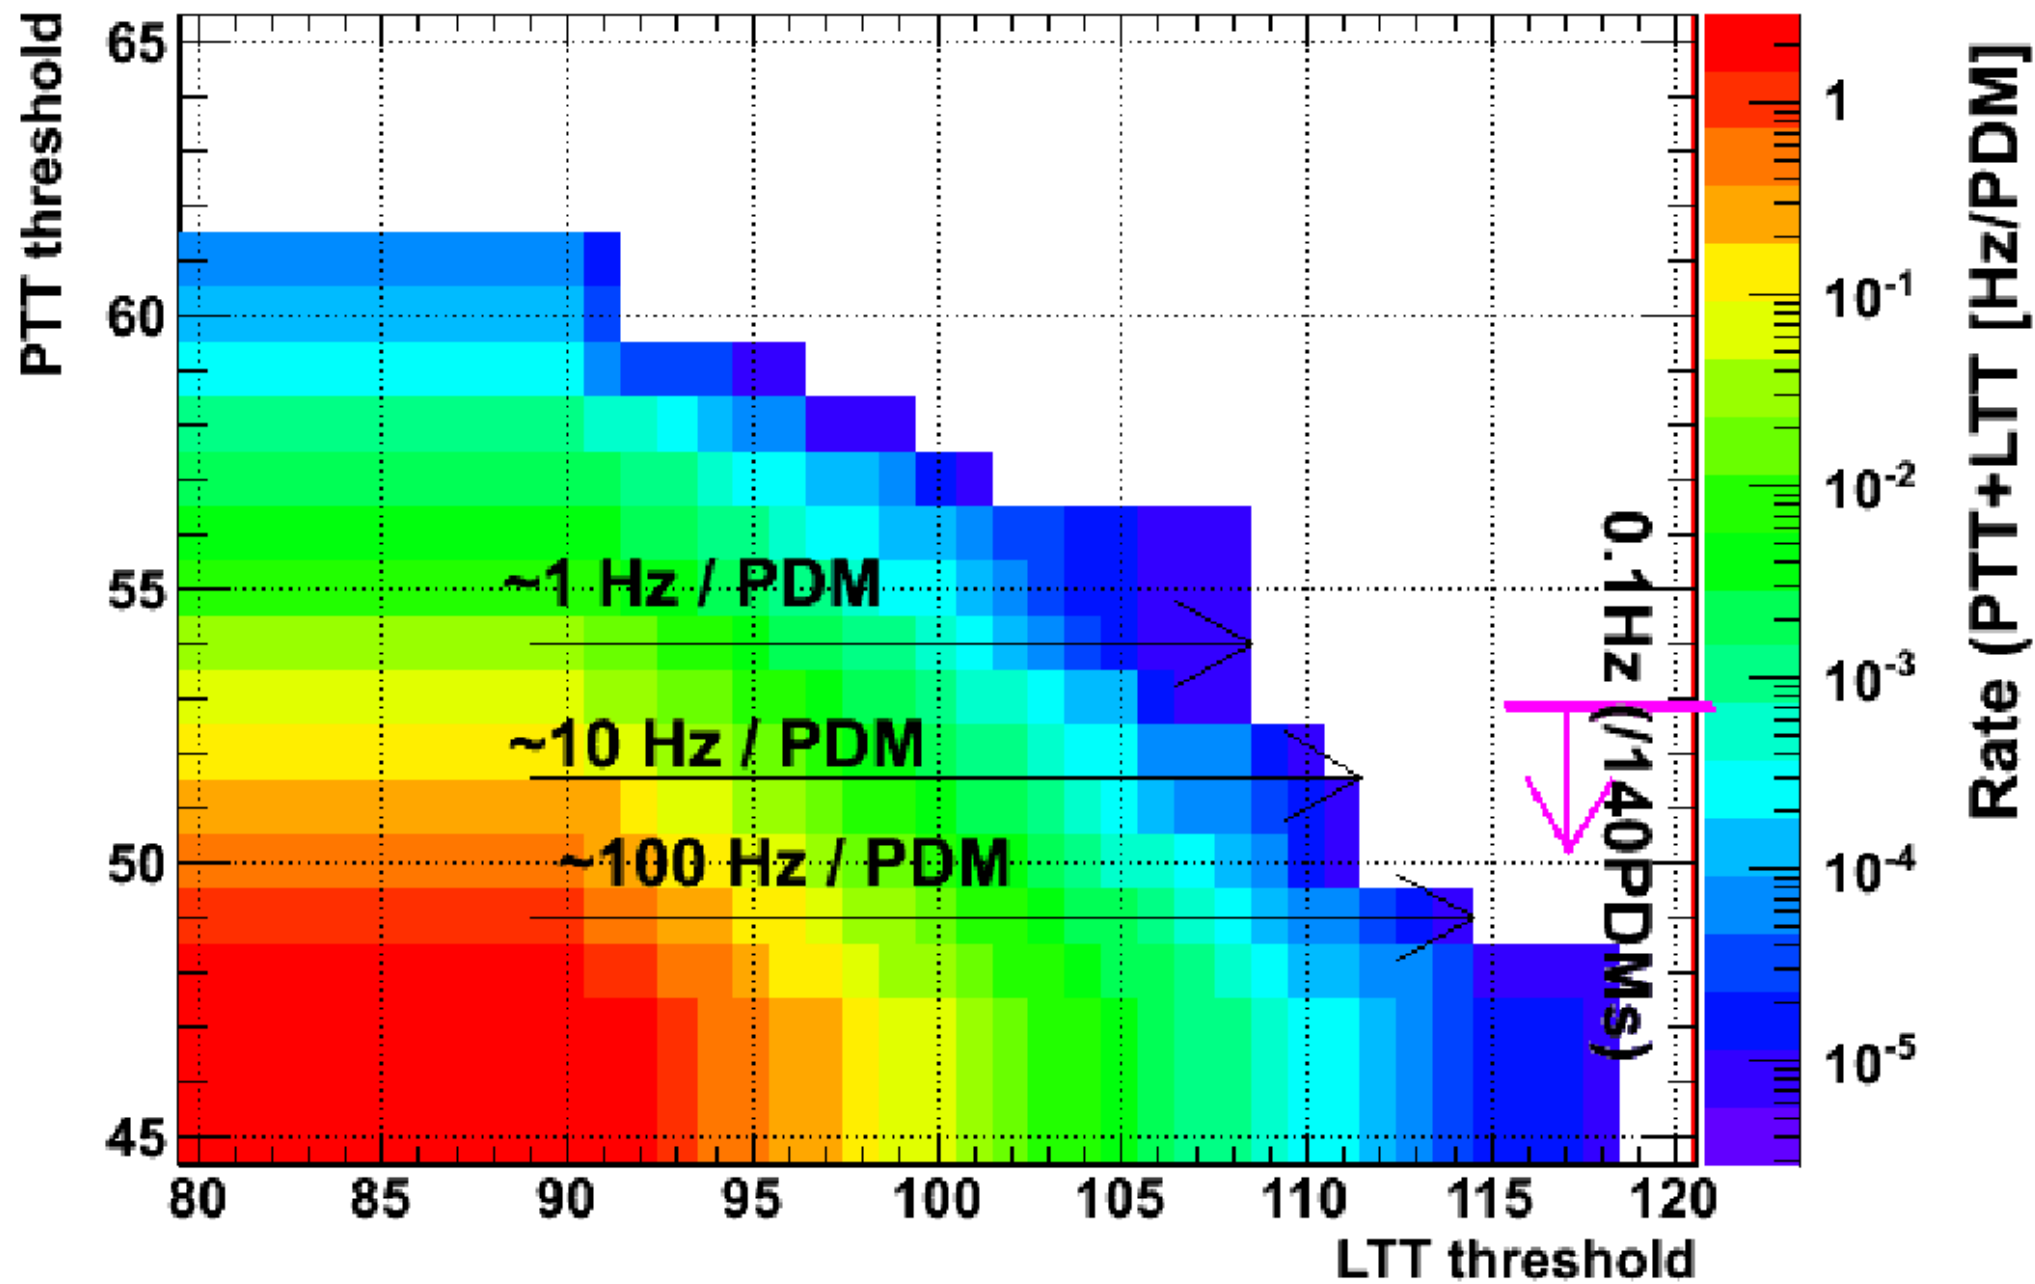

M64 config

Background rate M64 config

PTT integration thresholds:	
"red"	49
"blue"	50
"green"	51
"black"	52

M64 config

Summary, todo

- Checked trigger rates obtained from the code compatible with expectation
- Visualisation at present level don't show structures
- Negligible influence of the observed bug in the code to the obtained results
- Improved random number generation OK
- The code modified for M64 configuration and prepared to start massive simulation
- Pattern recognition of the obtained data under study
